

CREDIT CARD MINDER

Abstract

Disclosed is a credit card minder which ensures that credit cards are returned to a wallet or carrier within a predetermined time interval. The credit card minder includes a card carrier storing at least one card and a radio tag provided on each card. The radio tag transmitting a first radio frequency signal at periodic intervals including an identifier uniquely identifying the card. A receiver provided in the card carrier receives the first radio frequency signal, and triggers a signaling device if the first radio frequency signal is not received within the specified interval.
